STL ECLIPSE[®] OPTIC TECHNOLOGY

ECLIPSE[®] TIR OPTICS:

TIR Optics produce a highly concentrated beam of light for each individual LED creating a layering of light output as a result. This allows the TIR Optics to offer performance with fewer LEDs per module & a more precise focal output.

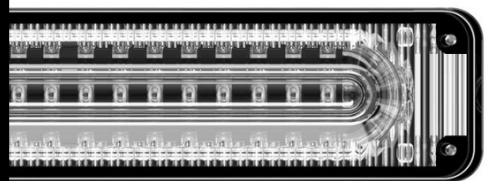

Specs:

- 70° horizontal spread
- 20° vertical spread

ECLIPSE[®] LINEAR OPTICS:

Linear Optics produce a wide broad beam of light for each LED module. With powerful magnification, Linear Optics create ultra-wide light dispersal, allowing for greater off-axis visibility.

Specs:

- 110° horizontal spread
- 20° vertical spread

AVAILABLE CARBINE OPTICS

FLOODLIGHT OPTICS

Floodlight Optics provide a wide spread of light to better illuminate nearby areas.

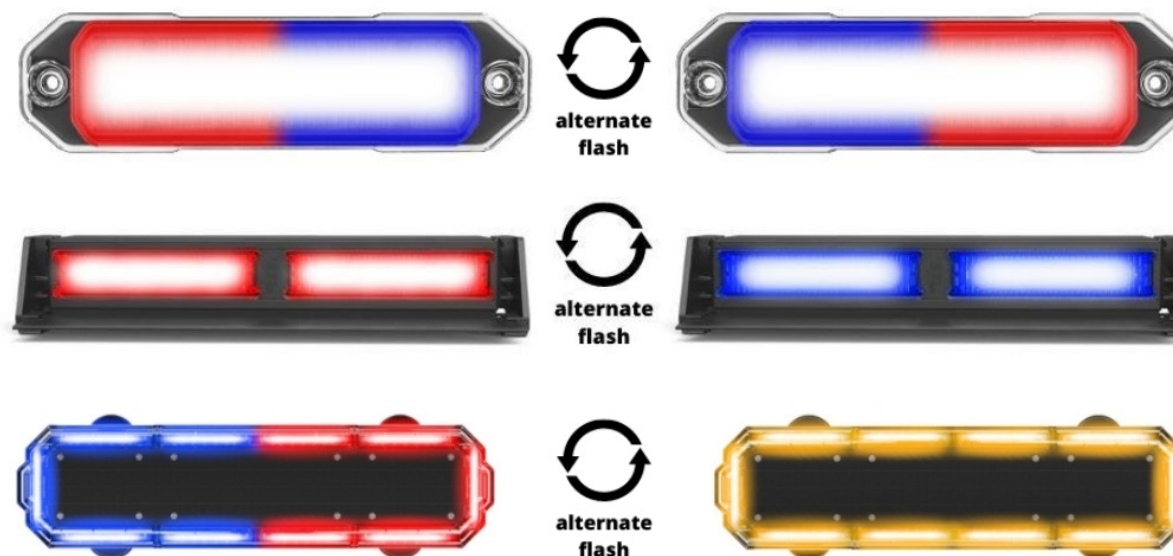

HYBRID OPTICS

Hybrid Optics are comprised of both Floodlight & Spotlight Optics, providing a balance between further visibility & wide light spread.

STL MULTICOLOR LINEAR

All STL Linear products now come equipped with **MULTICOLOR** technology which features specialized flash patterns using dual color LED modules. These include **alternating color flash patterns**, specially designed for **MULTICOLOR** products, along with a few **single color flash patterns** of both primary & secondary LED colors. This lets you run more appropriate colors for different applications.

OPTIONAL UPGRADES

SUPER TAKE DOWN[®]

The Super Take Down upgrade converts all forward facing LED modules into MultiColor LED modules. This upgrade retains your Light Bar's warning colors in warning mode & activates Clear in Super Take Down mode.

RED BRAKE LIGHT

The Red Brake Light upgrade converts LED modules into MultiColor LED modules. This upgrade retains your Light Bar's warning colors in warning mode & activates Red in Brake Light mode.

BACKLIGHT

Backlight functionality provides illumination for buttons on select control boxes, allowing easier operation in low-light conditions. There are two activation methods.*

1. Button Activation:

Press the dedicated backlight button (marked with a light bulb symbol) to turn illumination on or off.

2. Automatic Activation (White Cable):

Connect the standalone white cable to your vehicle's headlight (+12VDC) line. This automatically activates the backlight illumination when the vehicle's headlights are turned on.

Important: Before connecting the white cable, ensure the backlight button is off (not illuminated). If it's on during wiring, it will remain permanently lit.

* You must choose one activation method. Once the white cable is connected, the button activation method no longer functions.

DIM MODE

Dim Mode allows you to quickly reduce the brightness of your connected lightbar, ideal for situations where full brightness isn't necessary or desired.

To toggle between full and lower brightness, press the dedicated DIM button on your control box.
